Dear customer,

In reference to the claim referred "the entry of foreign bodies (metal)".

Code of claim: L130RGA 4C/L080RGA 1F

Brand: Campos

Reference: PS-2021-0360

As part of our canning process, clean loins pass through the Metal Detector, then they are placed in the filling machine, which fills the empty cans automatically, and finally all cans are sealed hermetically. Additionally there are covers after Metal Detection stage to avoid any contamination from overhead infrastructure.

We have reviewed all Metal Detector records from packaging lines finding no issues. Also, we have tried unsuccessfully to trace the origin of this wire-like contaminant without finding the probable source.

Attached traceability report and evaluation of counter samples showing no issues in that can code.

Despite all this, we will take extreme care during the review and calibration of our metal detector equipment and we will reinforce the training of their operators.

Best regards,

Lucciola López P.
Chief of Quality Control
